# 1. Selected Application

## Duolingo

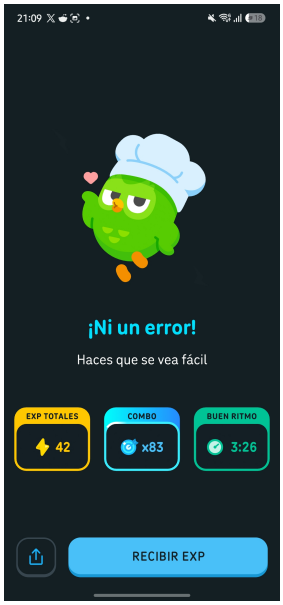

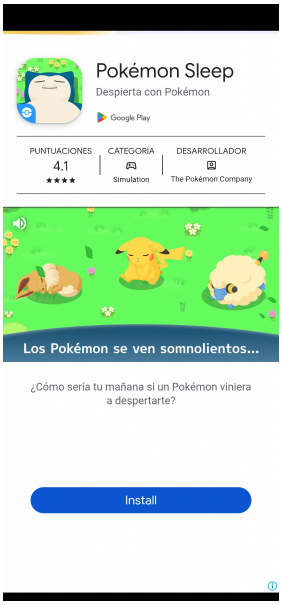

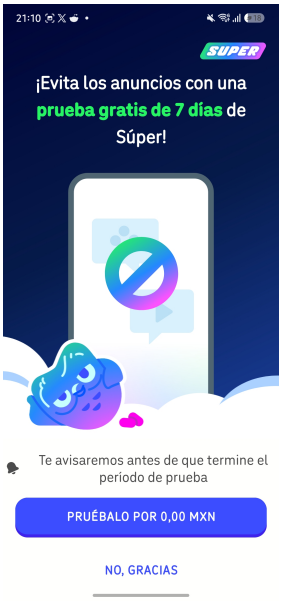

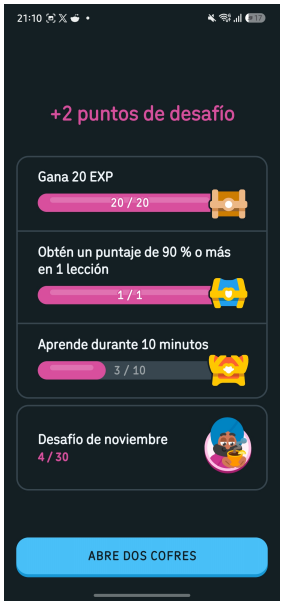

Finishing a Lesson

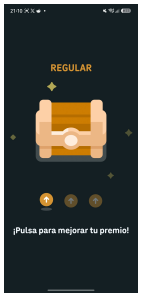

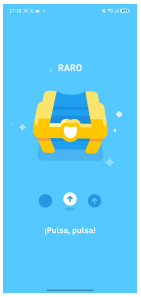

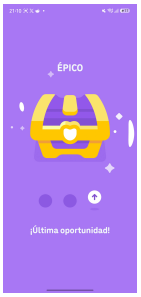

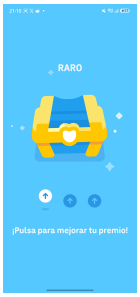

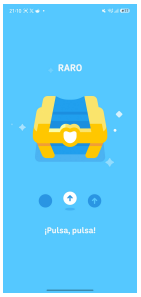

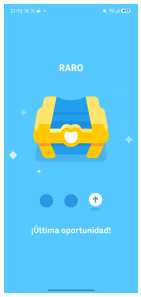

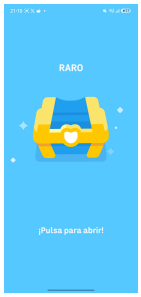

After finishing a lesson in Duolingo, there are several pages that make the process of returning to the main page to begin another lesson or access any other feature very slow.

# 2. Current User Flow

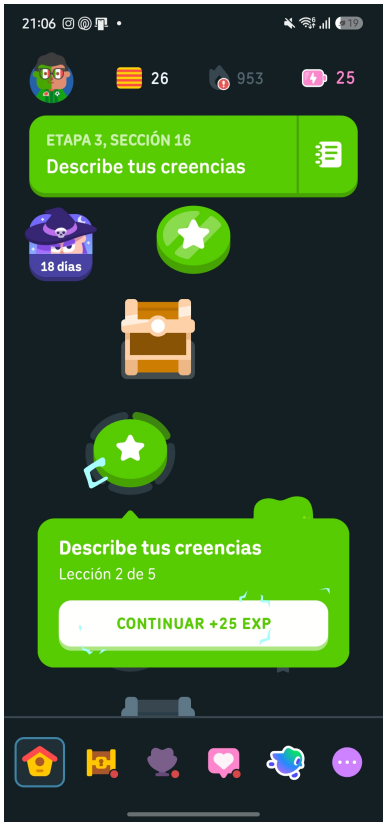

Currently when finishing a lesson there is a long painstaking process of activities to do in order to continue learning or exiting the app. It consumes a lot of time, and makes you uncertain about your progress.

Finished lesson → External Ad → Super Duolingo Ad → Monthly challenges progress → Monthly challenges rewards → Streak progress → Challenges update → Friend streaks progress → Jigsaw puzzle rewards → Main page

| Finished Lesson | External Ad | Super Duolingo Ad | Monthly Challenges Rewards |
|---|---|---|---|
|  |  |  |  |

| Monthly Challenges Rewards | | | | | | | |
|---|---|---|---|---|---|---|---|
| Chest 1 | | | | Chest 2 | | | |
|  |  |  |  |  |  |  |  |

| **Streak Progress** | Challenges Update | | **Friend Streaks Progress** |
|---|---|---|---|
|  |  |  |  |

| Jigsaw Puzzle Rewards | | **Main Page** |
|---|---|---|
|  |  |  |

# 3. UX Analysis

## 3.1. Problems and Difficulties

The main problem is extreme interaction and screen changes, only eaching the main learning path sometimes requires navigating through 19 different full-screens (Lesson Complete → External Ad → Super Duolingo Ad → Monthly Challenges → Chest 1 → Chest 2 → Streak → Challenges Update → Friend Streaks → Jigsaw Puzzle → Main Map).

Every single screen needs a tap to change and progress, unnecessarily prolonging completion time prolonging the primary intent after completing a lesson which is either to study another unit or to close the application.

You are presented with several ads, milestones and rewards before getting the most important screen which is the streak progress as most users practice their lessons to keep their streaks alive.

The user has no autonomy over what things they want to do and are ultimately trapped in the animations, vibrations colors and buttons until the final screen is reached.

The sense of achievement gets diluted over the several objectives the user has to process at once:

- EXP
- Gems
- Streaks
- Friend Quests
- Monthly Badges
- Chest Rewards
- Puzzle pieces

Turning rewards into a chore of pressing the same button 20 times, with no way to see how many actions remain before returning to the main page.

## 3.2. Opportunities for improvement

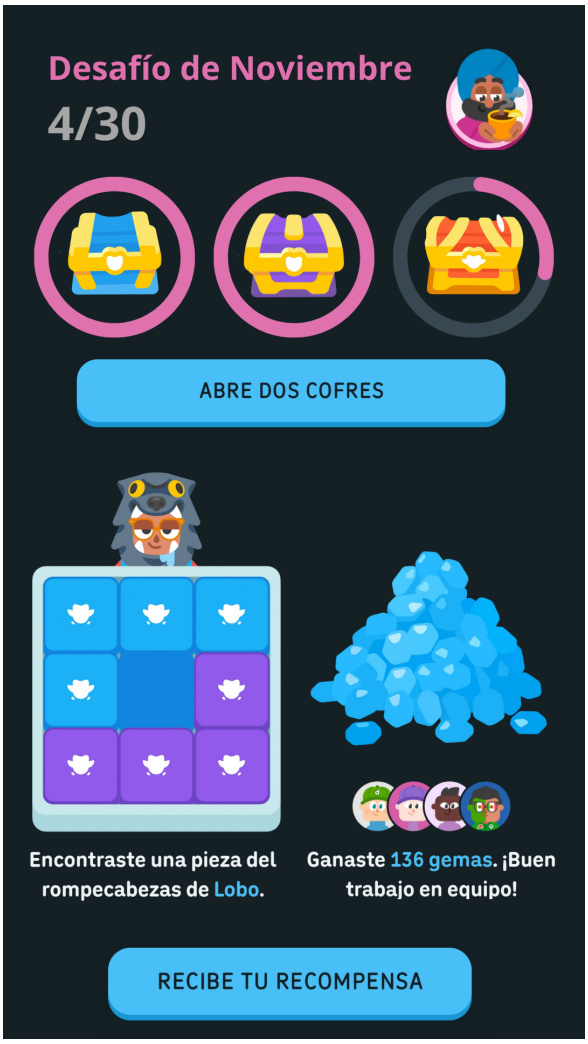

Reucing the Post-Lesson Screens into a couple of unified dashboards would help reduce time and fatigue of users to get back to the main page.

The first dashboard would contain the main stats, such as the lesson's EXP, Accuracy and Time, it would also contain the Streak animation and week calendar, the Friend Streaks and Super Duolingo Info, it would also contain a button to Skip All rewards and if necessary it would give them to you automatically through an animation.

The second dashboard would contain the information of monthly challenges and badges, as well as the jigsaw pieces and any other seasonal event or information.

When unlocking chests and rewards the interactions would be reduced to a simple animation and automatical reward collection.

## 4. Design Proposal

| Stats Dashboard | Rewards Dashboard |
|---|---|
|  |  |

## 5. Proposed user flow

This new design allows the user to have all the useful information related to the lesson and main app gimmick (Practicing everyday to mantain a streak alive) rightaway after finishing a lesson, it gives an option for people that are not interested on the game dynamics of the app such as the monthly badge, costumes, jigsaw puzzle pieces and social challenges. If the user wishes to continue a second dashboard would appear containing all the rewards' information and an option for the user to open what they really want.

When opening chests, instead of having to click 4 times, an animation would play and give the rewards immediately without having to click a claim button.

The new User Flow would be:
**Finished Lesson** → **Statistics Dashboard** → **Rewards Dashboard** → **Main page**

## 6. Justification

As of right now finishing a Duolingo lesson feels as if the app were burying the satisfaction under an endless wave of pop-ups, ads, and junk information that holds users hostage for up to 20 clicks.

My redesign fixes said feeling by cutting down the noise and giving learners back control over their time and progress on the app. Instead of forcing users to click through every single badge, puzzle, and chest one by one, everything is bundled into just two straightforward screens, respecting the user's main goal of learning a new language.

The first screen gives learners what they actually care about immediately, their score and their streak. If they want to jump straight into another lesson or simply close the app, the "Skip"button lets them move on immediately without sitting through tedious animations.

The second screen gathers event badges, social quests, and puzzle pieces onto a single secondary dashboard, users can see all their extras at a glance without having to open and claim each one separately.

This new dynamic puts an end to the reward fatigue, collecting rewards shouldn't feel like a chore.

Ultimately, this turns a frustrating obstacle course back into a smooth and rewarding study habit.
